An aerial photograph of a dark blue ocean. The water is textured with small waves and ripples. A prominent white wake from a ship stretches diagonally across the lower right portion of the frame. There are also some lighter, frothy patches of water scattered across the surface.

Urbit is your last computer.

Urbit for the people...

Urbit is a system where everything works seamlessly

Urbit does not own your data - you own your Urbit

Urbit restores the original vision of the internet

Urbit is not a blockchain

Urbit is not a cryptocurrency

Urbit is not a magical time-warp machine (although...)

Urbit is a peer-to-peer internet being built from scratch to be more private, secure, and durable than the current internet.

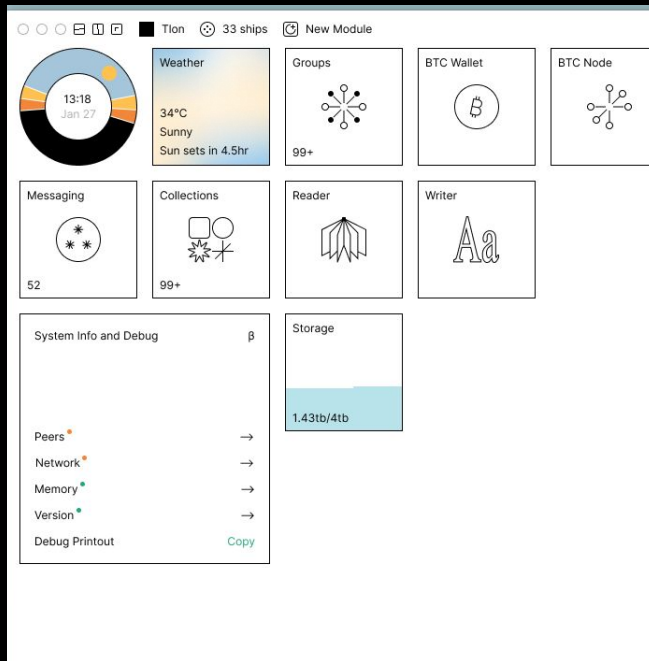

A super-private computer, combined with an ID, which is connected peer-to-peer with other Urbit computers.

Urbit ID

No intermediaries (centralized middle servers)

2^8	256	galaxies
$\sim 2^{16}$	65,280	stars
$\sim 2^{32}$	4,294,901,760	planets

Urbit is minimalistic

The components:

1. A peer to peer network (direct communication)
2. You own server (computing happens on your server)
3. Permanent digital ID (decentralized ID, backed by code)

4. Incentive for good behaviour (scarcity)
5. Tools for people (50,000 lines of code)
6. Urbit is deterministic (efficiency)
7. Urbit is private (no tracking)

The killer feature of Urbit is... Urbit

Comparison:

Urbit vs Reddit (cookies)

Chat for discussions

Place for links & notes

Logins and security

Or use Urbit

Urbit vs Social Networks (you own the data)

Urbit vs Smart devices (you own the data)

Urbit vs Google Docs (you own the data)
